## Description

**CE-025 Servo Motor** (in 810 and 812, it is used to rotate a lead screw so to move the wedge up or down)

Servo motors or “servos”, as they are known, are motors paired with a position encoder that provide position and speed feedback with high precision. They are controlled by a Servo drive which monitors the feedback from the servo motor and automatically adjusts its output to correct for differences between the commanded value and actual.
